FOR IMMEDIATE RELEASE

TOQidex Launches Web-Based Consumer App With Personalized Cannabis Prediction Engine

December 22, 2025 – Toronto, ON — TOQidex has launched a major Consumer Update to its free, web-based cannabis app, introducing a personalized prediction engine that helps users anticipate how future cannabis products may affect them. The system is based entirely on their own logged experiences and the chemical composition of the products they consume.

The updated platform is now live at www.toqidex.com and is available for free on any desktop or mobile browser. No download is required.

From Brand Feedback to Personal Prediction

Originally developed for cannabis brands to upload Certificates of Analysis (COAs) and collect structured product feedback, TOQidex has evolved into a consumer-facing tool designed for personalization. By analyzing each user's data, the platform offers meaningful insights into how cannabis may interact with their body and mind. It moves beyond traditional labels like "Indica" or "Sativa."

Log Quickly, Learn Clearly

Using TOQidex's intelligent product scanner, users can take a few photos of a cannabis product, such as the label or packaging. The platform automatically extracts key information, including cannabinoid and terpene content, potency, format (e.g., flower, edible, vape), and batch number. Manual entry is minimized, and users can immediately log how the product affected them emotionally, physically, or symptomatically.

This builds a personal history that is easy to search, reference, and train models for predictions over time.

A System That Learns From You

Once a user has logged 10 distinct cannabis products, TOQidex's prediction engine activates. It analyzes:

- Cannabinoid and terpene combinations
- Potency (including THC and CBD levels)
- Product format (inhalation or ingestion)
- Recreational or medical use context
- Emotional and physical outcomes, including symptom relief

The result is probability-based predictions that indicate how similar products may affect that user in the future. Confidence indicators are always shown, and accuracy improves as more data is added.

Example: Meaningful Personal Feedback

A user who repeatedly logs anxiety after using products with a certain terpene profile will begin to see probability scores warning that future products may produce a similar effect. The same applies to other tracked outcomes, whether recreational like relaxation or creativity, or medical like improved sleep or nausea relief.

“People deserve a way to know which terpenes are for them, which products helped their symptoms, and which ones might give them anxiety,” said **Drew Henson**, Founder and CEO of TOQi Technologies. “Of course, we can’t definitively tell anyone how a product will feel, but we can predict the probability. That creates real value for the consumer.”

Built for Consumers

- **Web-based access** — No downloads or app store required
 - **Optimized for desktop and mobile** — Use it where and how you prefer
 - **Personalization over labels** — Driven by your data, not strain names
 - **Transparency over hype** — Confidence levels are clearly shown and improve with use
 - **Free to use** — No subscriptions or upselling. API access is the only paid feature
-

About TOQidex

TOQidex is a free web-based cannabis prediction and tracking platform designed to give consumers insight into how cannabis may affect them, based on their personal history and product chemistry. It is a wholly owned subsidiary of **TOQi Technologies Ltd.**, a Toronto-based cannabis technology company. TOQi began as a leader in wireless cannabis hardware and has since expanded into intelligent consumer software focused on improving experience and product predictability.
